I.S. BARRIER INSTALLATION REQUIREMENTS

In the GTC 200 installation instructions for installation of the I.S. barrier in Highline and Salesmaker dispensers, it specifies the removal of a 5/16" bolt to install the barrier. In some units, instead of bolts, there are studs which can not be removed. In this case, it will be necessary to drill a 5/16" hole. The following two requirements must be met:

- 1) The body of the 218AY00 barrier assembly must be installed in a Class I division 2 area.
- 2) The threaded portion of the barrier assembly must be installed in the Class I division 1 area with the probes.

In most dispensers, there is a solid steel partition, or vapour barrier separating the division 1 and 2 areas. The barrier must be installed in a hole through this vapour barrier.
